## Summary

Computer Science (AI/ML) student seeking software engineering internships in backend, full-stack and applied ML. AI & ML internship at VSC DigiTech; three live Python and FastAPI projects with 710 automated tests and CI/CD; team lead at Smart India Hackathon 2026.

## Education

**Sri Sri University, Cuttack, Odisha** Expected Graduation: June 2028
B.Tech, Computer Science and Engineering (Artificial Intelligence and Machine Learning) CGPA: **7.7** / 10.0
*Coursework:* Data Structures and Algorithms, DBMS, Computer Networks, Operating Systems, Machine Learning.

## Experience

**AI & ML Intern** February 2026 – March 2026
*VSC DigiTech Pvt. Ltd., Hyderabad, India*

- Built a five-module sales intelligence platform (Python, Pandas, scikit-learn, Streamlit) on six months of e-commerce data for 36,893 customers: market-basket analysis (lift), RFM and K-Means segmentation, Random Forest revenue forecasting on lag features, customer similarity and upsell/downsell price bands.
- Clustered customers into four segments, from dormant low-value to high-value VIP, and found that only 10.75% were repeat buyers, to target retention.
- Developed a content-based recommender over 45,699 products (TF-IDF, cosine similarity): 0.64 manual relevance on 10 hand-checked queries.

## Projects

**ArchLens** — *Engineering Health Scorer for GitHub Repositories*
github.com/vishnuatgit/ArchLens · live demo *FastAPI, SQLAlchemy, Alembic, PostgreSQL, Docker, Locust*

- Built a scorer that rates public GitHub repositories 0–100 across seven engineering dimensions and checks dependencies against OSV.dev; web app, REST API, CLI and a GitHub Action that comments on pull requests.
- Cut 30 s request stalls at 50 concurrent users to p95 510 ms with 0 failures, by moving blocking database calls off the async event loop and resizing the connection pool (found with a Locust load test); 332 tests in CI.

**DeepBell** — *Self-Monitoring Incident Response Lab*
github.com/vishnuatgit/DeepBell · live demo *FastAPI, scikit-learn, LangChain, Prometheus, Grafana, Docker*

- Built a FastAPI service that samples its own CPU and memory every 2 s, flags anomalies with a baseline check and an Isolation Forest, and opens incidents: 0 false incidents and 4 s detection in a seeded benchmark.
- Generated incident reports with Gemini via LangChain from each incident's timeline (template fallback); added alert rules, webhooks, Prometheus metrics and snapshot rollback.
- Designed a safe public fault-injection lab (caps, cooldowns); cleared 48 OSV.dev advisories; 144 tests in CI.

**SANKET** — *AI/NLP Safety-Report Triage* Team Lead (Signal-0), Smart India Hackathon 2026
github.com/sukanya-2006/SANKET · live demo · team of 6 *FastAPI, Groq LLM, scikit-learn, Supabase*

- Led the team and owned evaluation and integration (64 of 130 commits): built a cross-validated harness comparing an LLM classifier with a TF-IDF baseline (baseline F1 0.754 ± 0.077, 5-fold) on 173 gold-labelled reports; found and fixed a leaked train/test split and prompt contamination.
- Rewrote the labelling rubric after round one failed its agreement check (Cohen's kappa 0.08); two reviewers working separately then agreed on 37 of 38 re-labelled reports (kappa 0.947).

**SupplyTrace** — *Supplier Invoice Validation and Risk Scoring*
github.com/vishnuatgit/SupplyTrace · live demo *Python, FastAPI, scikit-learn, Pandas, pytest*

- Built a validator for supplier XML invoices: five rules, exact (SHA-256) and likely duplicate detection, and a human review queue with append-only history; 28.9 invoices/s (p95 48 ms) in a local benchmark.
- Hardened uploads (defusedxml, 1 MB cap, depth limit) and added an experimental Random Forest risk score with tree-path explanations; 234 tests in CI.

## Technical Skills

**Languages:** Python, TypeScript, JavaScript (ES6+), SQL, C, Java (Basic)
**Backend and Web:** FastAPI, REST APIs, SQLAlchemy, Alembic, PostgreSQL, SQLite, React, Next.js
**ML and AI:** scikit-learn, Pandas, NumPy, LangChain, LLM APIs, model evaluation (cross-validation, F1, PR-AUC)
**Testing and DevOps:** pytest, Locust, Docker, GitHub Actions (CI/CD), Prometheus, Grafana, Git, Linux
**Core CS:** Data structures and algorithms, OOP, API and database design, concurrency, computer networks
